

PREVIEWS

Diagenesis from enhanced hydrocarbon recovery	<i>Observed diagenetic changes from a rising hydrocarbon-water contact during production time in the Haidach field, Austria, include carbonate cementation, K-feldspar overgrowths, authigenic quartz overgrowths, pyrite formation, and poorly crystallized authigenic clay minerals.</i>	<i>789</i>
Two classic shales studied	<i>Hydrocarbon retention and porosity evolution are generally strongly related to changes in kerogen density brought about by swelling and shrinkage as a function of thermal maturation. Free oil and bitumen are not associated with the layers richest in organic matter.. . . .</i>	<i>807</i>
Diagenesis in tight gas sandstones	<i>This study documents the types and degree of diagenesis that the Bashijiqiike reservoir, Tarim Basin, China, has experienced. It examines the mechanisms for maintaining good reservoir quality in sandstones that are buried at great depth.</i>	<i>829</i>
The Arabian plate and unconventional targets	<i>High total organic carbon horizons, northern Saudi Arabia, are being assessed for their unconventional shale-gas potential. Heterogeneity has resulted from the interplay of sea-floor topography, ocean currents, sediment supply, and variations in the melting rate of the Gondwanan ice sheet.</i>	<i>863</i>
Deformation adjacent to salt diapirs	<i>Understanding the structural deformation and state of stress adjacent to salt bodies is critical to petroleum exploration and drilling. Upbuilding in tectonically stable areas is a significant component of salt diapir growth. Once the diapir roof is penetrated, it forms a megaflap.</i>	<i>887</i>
SEM-MLA for detrital provenance analysis	<i>This study of scanning electron microscopy mineral-liberation analysis provenance analysis shows that diverse processes operate in a complex deep-sea environment over time to control sediment routing and accumulation.</i>	<i>907</i>
